GLOBAL STUDY SUPPORT / REFERENCE SERIES

Financial Performance Dashboard

ILLUSTRATIVE DEMONSTRATION - NOT CLIENT WORK

Objective

Demonstrate a simple financial reporting model with invented monthly revenue and direct costs. Download financial-data.csv to reproduce the calculations in a spreadsheet or business intelligence tool.

Metric definitions

Revenue = sum of monthly revenue. Gross profit = revenue minus direct costs. Gross margin = gross profit divided by revenue. Calculate period margin from period totals rather than averaging monthly margins.

Data model and interaction

The dataset contains one row for each month in 2025. In Power BI, use a month dimension with chronological sorting and measures for revenue, costs and gross margin. The website preview lets you compare the full year and half-year totals.

Scope and limitations

All data is synthetic. Direct costs exclude operating expenses, tax, interest and depreciation. This is not a complete income statement, investment recommendation or audited financial report. No native Power BI file is included.

Period	Revenue / Direct costs	Gross margin
Jan-Jun	54,000 / 34,800	35.6%
Jul-Dec	74,000 / 44,800	39.5%
Full year	128,000 / 79,600	37.8%
